

## Adelette delivered with new Plug-ins

---

Adelette, JCMB's viewer, is being used by our customers to access graphic representations of their distribution network. Until recently, Adelette was limited in its usage to graphic source data coming from Adele (JCMB's mapping tool). This meant that you could only display maps that were created in Adele.

However, because of the object-oriented technology JCMB used to develop Adelette, it is now possible to create plug-ins that generate a graphic representation of any external mapping/GIS tool, available on the market.

The ability to visualize any distribution network data model coupled with all the existing network and data validation plug-ins available, results in a powerful and flexible tool. You can use this tool to identify errors such as: device location, connectivity errors, device states discrepancies, phasing problems, parallel sources, point of service (customer/transformer link) mismatches, etc. The corrections can then be transmitted to the proper department and applied to the utility data model.

Additional plug-ins will be available early next year. These new plug-ins will further enhance Adelette's distribution and data validation features. For instance, we are currently developing a red lining plug-in that will enable an Adelette user to define required modifications within a graphic representation.

With these enhancements, Adelette is the perfect tool to use as a pre-validation, pre-process module before exporting data from your mapping/GIS data model toward any other applications.

Device selected: Single Phase Padmount Transformer(HH22202)
